```
The present invention describes an isolated WHC class II compound (I)

comprising: (a) an WHC class II component comprising at least a portion

of an WHC class II alpha chain and at least a portion of an WHC class II beta

beta chain, such that the WHC class II alpha chain and WHC class II beta

chain form a peptide binding groove; (b) a spaceholder molecule; and (c)

an effector component, where the effector component is linked to the MHC class II component. Also described: (1) a pharmaceutical composition

comprising the MHC class II molecule and a carrier; (2) a method of producing an MHC class II compound; (3) a method of directly identifying an antigen-specific T cell; (4) a method of tregulating an immune disorder in a subject; and (5) a method of regulating an immune disorder in a subject; and (7) a method of treating an immune disorder avivo in a subject; and (7) a method of treating an immune disorder avivo in a subject; and (7) a method of treating an immune disorder avivo in a subject; and (7) a method of treating an immune disorder avivo in a subject; (1) has criticies, and can be used in gene therapy. The MHC class II compound (1) can be used for preparing a composition for treating immune

contricties, and can be used in gene therapy. The MHC class II compound infections, parasitic infections, neoplastic disease, autoimmunity or traiting immune control infections, parasitic an MHC class II compound from the present invention.
```

Sequence 13 AA;

Sequence 12 AA;

The present invention describes an isolated WHC class II compound (1)

Comprising: (a) an WHC class II component comprising at least a portion

of an MHC class II alpha chain and at least a portion of an WHC class II beta

Co beta chain, such that the WHC class II alpha chain and WHC class II beta

CC clain form a peptide binding groove, (b) a spaceholder molecule; and (c)

an effector component, where the effector component is linked to the MHC

CC class II component, Also described: (1) a pharmaceutical composition

CC class II component, Also described: (2) a method of producing an MHC class II compound; (3) a method of directly identifying

CC class II component, Also described: (1) a method of treating an immune response

CC in a subject; (5) a method of treating an immune disorder in a subject; and

(7) a method of treating an immune response ex vivo in a subject; and

(7) a method of treating an immune disorder ex vivo in a subject; and

(7) a method of treating an immune disorder ex vivo in a subject; and

(7) a method of treating an immune disorder ex vivo in a subject; and

(7) a method of treating an immune disorder ex vivo in a subject;

(1) can be used for preparing a composition for treating immune

CC disorders, e.g., viral infections, bacterial infections, parasitic

CI class II compound from the present invention.

CC an MHC class II compound from the present invention. ö MHC class II compound, MHC class II component, MHC class II alpha chain; MHC class II beta chain; peptide binding groove; spaceholder molecule; effector component, immune response; immune disorder; virucide; antibacterial; antiparasitic; cytostatic; immunosuppressive; gene therapy; viral infections; bacterial infection; parasitic infection; neoplastic disease; autoimmunity; toxicity; human. New MHC class II compound, useful for preparing a composition for treating immune disorders e.g. viral infections, bacterial infections, parasitic infections, neoplastic disease, autoimmunity or toxicity. Gaps ö Human MHC class II compound spaceholder molecule SEQ ID NO:3. DB 8; Length 12; 0; Indels 0.23; Mismatches Score 50; Pred. No. ( Claim 11; SEQ ID NO 3; 92pp; English.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention describes a transgenic plant comprising a recombinant polynucleotide of any one of more than 500 nucleotide sequences fully defined in the specification or its complement. The method of the invention can be used to produced a plant having altered traits such as: enhanced tolerance to abiotic stress; glyphosphate tolerance; hormone sensitivity; disease resistance; sugar sensing; early or late flowering;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New transgenic plant comprising a recombinant polynucleotide of any one of more than 500 nucleotide sequences, useful in bioinformatic search

altered flower structure, change in stem bifurcations, altered branching pattern, reduced apical dominance, reduced trichome density; lack of trichomes reduced actopic trichome development; altered trichome development; increase in trichome number; altered stem morphology; increased root growth; increased root hairs; altered seed development; altered call proliferation or call differentiation; rapid development; premature senescence; increased necrosis; increase in seedling or plant size; decreased plant size; leaf morphology; seed morphology; seed biochemistry; increase in root anthocyanins; increase in plant anthocyanins, or alteration in light response or shade avoidance. The transgenic plant, polymucleotides and polypeptides are useful in bioinformatic search methods. This is the amino acid sequence of a plant transcription factor, and an orthologue of Arabiodopsis thaliana transcription factors isolated in the invention, that can be used in the creation of a transgenic plant with altered traits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

transgenic plant, useful in developing phenotypes with altered or improved characteristics or traits.

Claim 1; SEQ ID NO 989; 213pp; English

the invention relates to a transgent plant compliable and inclinated in transfer of the complementary sequence comprising a polymerlectide, that initiates transgering a sequence encoding a polymerlectide, that initiates transgering to a transgering and plant, an expression cassette (comprising as Abo01588 (Alco included are using a transgering plant to grow a progeny plant, an expression cassette (comprising a recombinant polymerlectide described above), a host cell comprising the expression cassette, producing a medified plant having a modified trait, identifying a factor that is modulated by or interacts with a polypoptide encoded by the polymuclectide sequence and identifying at least one downstream polymuclectide sequence and identifying at least one downstream companies encoded by the polymuclectide sequence and identifying a plant that has an altered the polymuclectide sequence and identifying a plant that has an altered transgeric plant is useful for producing a plant that has an altered transgeric plant is useful for producing a plant that has an altered transgeric plant is useful for producing a plant that has an altered transgeric plant is useful for producing a plant that has an altered transgeric plant is useful for producing a plant that has an altered transgeric plant is useful for producing a plant that has an altered transgeric plant is useful for producing a plant that has an altered transgeric plant is useful for producing a plant that has an altered transgeric plant is useful for producing a plant that has an altered to complix, to decrease to semistivity to bascisic stid an altered usecptibility to because to potassium the plants of t The invention relates to a transgenic plant comprises a recombinant

        content, an alteration of leaf glucosinolate content, change in seed biochemistry, an increase in seed oil content, decrease in seed fatty acid content, decrease in seed fatty acid content, increase in seed fatty acid content, increase in seed protein content, decrease in seed protein content, alteration in seed prenyl lipid content, increase in seed prenyl lipid content, increase in seed pretain in seed prenyl lipid content, increase in seed protein secondary metabolism, increase in root anthocyanins, increase in plant anthocyanins, and alteration in light response or shade avoidance. The present sequence represents an orthologue of a thalecress transcription factor isolated from Rice.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Plant; transcription factor; transgenic plant; abiotic stress tolerance; osmotic stress tolerance; cold tolerance; heat tolerance; low nitrogen tolerance; low phosphate tolerance; fungal disease; glyphosate resistance; flowering; fertility; seed development.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to novel plant transcription factor proteins (1) and nucleotide sequences (II) (ADO61534-AD063778). The sequences can be used to produce transgenic plants, which overexpress (II), where the transgenic plant has an altered trait as compared to a non-transgenic plant or wild-type plant. The transgenic plant comprises an altered trait selected from increased tolerance to abiotic stress, increased tolerance to obld; increased clerance to common in cold, increased tolerance to cold, increased tolerance to cold, increased tolerance to heat, increased germination in heat, increased tolerance to heat, increased increased tolerance to low nitrogen conditions, increased tolerance to low nitrogen conditions, increased tolerance to low phosphate conditions, increased tolerance to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New recombinant polynucleotide encoding transcription factor polypeptides, useful for producing transgenic plants with advantageous properties compared to a reference plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Reuber TL;

The phenotypes and characteristics, comprising a molecule modification that phenotypes and characteristics, comprising a molecule encodes an amino acid sequence exhibiting at least 8% sequence in the cortholog alignments of Figure 1, a muclaic acid, which is a complement of cartholog alignments of Figure 1, a muclaic acid, which is a complement of cartholog alignments of Figure 1, a muclaic acid capable of the that the reverse muclocitide sequence has a sequence order which is the reverse of the muclocitide sequence order of (a) but a muclaic acid capable of is the reverse of the muclocitide sequence order of (a) but a muclaic acid capable of the property of the muclaic acid duplex at a temperature of 40-48 degrees C below the melting capable of causing transforming a regulatory sequence construct (comprising a first muclaic acid having a regulatory sequence construct (comprising first muclaic acid duplex and/or translation in a plant, operably linked to a second muclaic acid duplex. Also included are a vector construct, an isolated polypeptide comprising an amino acid muclaic acid maleuted. A nost cell comprising the vector construct, an isolated polypeptide comprising an amino acid muclaic acid muclaic acid into a host cell, transforming a host cell, detecting a muclaic acid into a host cell, transforming an isolated muclaic acid into a host cell, transforming an isolated muclaic acid maleured. A plant generated from the plant cell introducing an isolated acid maleure, a plant generated from the plant cell or seed, a plant plant cell, plant material or seed, a plant promoter so that the comprising the muclaic acid maleured. A plant material or seed, a plant part with the nuclaic acid maleured cell or seed, a plant part with the nuclaic acid maleured cell, intended acid muclaic acid maleured. A plant with the nuclaic acid maleured cell or a wild type plant), improving plant compressed to a wild type plant), improving plant promoter so that the component is ecopolately and progenitor plant exhibits faster rate 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The invention describes a recombinant DNA construct comprising a polymucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at the invention are also useful in physical arrays of molecules and as of the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme compositions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, increased resistance to plant disease, for increasing the rate of homologous recombination in plants, for increasing the rate of homologous recombination in plants, for introgen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This is the amino acid sequence of a plant full length insert polymeptide that can be used in the recombinant DNA construct of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New recombinant DNA construct, useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for conferring increased resistance to plant disease, or for improving yield.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Drosophila; developmental biology; cell signalling; insecticide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                        molecule (I) comprising any of 113 fully defined nucleotide sequences given in the specification, their encoded protein sequences, sequences given in the specification, their encoded protein sequences, sequences at least 60% identity to the nucleotide sequences. The methods and compositions of the present invention are useful for identifying.

C compositions of the present invention are useful for identifying L cancerous diseases of the lung. They are also used for identifying lung tissue, monitoring and identifying and/or designing antagonists of the polypeptide of the invention, gene therapy, production of transgenic polypeptide of the invention, gene therapy, production of transgenic animals and production of engineered lung tissue for treatment and research. Lung specific genes (LSGs) were identified by a systematic analysis of gene expression data in the LIFESEO Gold database using the data mining software package candidate lead automatic search program (CLASP). Genes were grouped into gene bins where each bin is a cluster of sequences grouped together where they share a common contig.

CC percentage level in the targeted tissue versus all the other tissues. The expression levels from cancer patients were compared with the expression cumour tissues from cancer patients were compared with the expression cumour tissues from cancer patients were compared with the expression compared with tumour or disease. This sequence represents a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       plant protectant; plant growth regulant; gene therapy; plant; recombinant DNA construct; physical array; plant breeding marker; cold tolerance; heat tolerance; drought tolerance; herbicide tolerance; extreme osmotic condition; pathogen tolerance; pest tolerance; growth rate; cell cycle pathway; disease resistance; galactomannan production; lignin production; plant growth regulator; plant growth; plant development; seed oil; protein yield;
                                                                                                                                                                                                                                                                                             New isolated human lung specific nucleic acid molecule, useful for identifying, diagnosing, monitoring, staging, imaging and treating lung cancer and non-cancerous diseases of the lung.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a new isolated lung specific nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .

                                                                                                                                                         capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of
                                                                                                                                                                                                                  insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes substantially purified human proteins
                                                                                                                                      invention relates to an isolated nucleic acid detection reagent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel human polypeptides and polynucleotides useful for diagnosing, preventing and treating cardiovascular disease, neurodegenerative,
                 isolated nucleic acid detection reagent for detecting 1000 as from Drosophila and for elucidating cell signaling and ce

                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequence (ABD1840-ABL16175) and the encoded proteins (ABB37737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                   New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell

                                                                                                                                                                                                                                                                                                                                                                                                                                              18-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                         18-JUN-1999
                                                        07-MAY-1999
                                                                                                                                                                              24-MAY-1999
                                                                                                                                                                                                                28-MAY-1999
                                                                                                                                                                                                                                                               07-JUN-1999
 Treferred to as open reading frame, ORFX, where X is 1.11491 lese lable 1 in the specification). ABN15752 encode the human ORFX proteins given in ABP00010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder. ORFX polynucleotide syndrome associated with ORFX-associated disorder. ORFX polynucleotide sequences can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benign tumours, Keloid, degenerative disorders, haemorrhage, osteoarthritis, neurodegenerative disorders, disorders related to organ transplantation, cardiovascular diseases, diabetes mellitus, systemic lupus erythematosus, hyperthroidism, cholesterol ester storage disease, various immune deficiencies and disorders, infectious diseases, autoimmune disorders such as multiple sclerosis, rheumatoid arthritis, autoimmune thyroiditis, myasthenia gravis, graft-versus-host disease and autoimmune disorders, myasthenia gravis, graft-versus-host disease and autoimmune inflammatory eye disease. ORFX proteins are also bone degenerating burns, incisions, ulcers, for treating sate opporosis, bone degeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues and conditions resulting from systemic cytokine damage. NB The sequence data for this patent did not form mpart of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

hybridizing (a-c), under conditions that permit formation of a nucleic acid duplex at a temperature of 40-48 degrees C below the melting temperature of the nucleic acid duplex. Also included are a vector construct (comprising a first nucleic acid having a regulatory sequence capable of causing transcription and/or translation in a plant, operably incled to a second nucleic acid having the sequence of the isolated nucleic acid molecule that is flanked by exogeneus sequence, a host cell comprising the vector construct, an isolated polypeptide comprising a maino acid sequence exhibiting at least 85% sequence identity to those cited above, introducing an isolated nucleic acid into a host cell, transforming a host cell, detecting a nucleic acid into a host cell, transforming a host cell, a plant generated from the plant comprising the nucleic acid molecule, a plant generated from the plant cucleic acid molecule (where the plant material or seed) comprising the nucleic acid molecule (where the plant material or seed) comprising the nucleic acid molecule (where the plant with the nucleic acid sequence, and a transgenic plant having a gene construct (comprising the nucleic compared to a wild type plant), improving plant promoter so that the component specially overexpressed in the transgenic plant exhibits faster rate of growth, greater fresh of dry weight of maturation, greater fruit or seed yield, higher tolerance to low phosphate concentration, or higher tolerance to low prospine or plant, or higher tolerance to low prospine or plant, or higher tolerance to low plant or plant, or higher plant promoter so plant promoter and plant or plant o pH, higher tolerance to low phosphate concentration, or higher tolerance to low mitrogen concentration than a progenitor plant, which does not contain the progenitor construct, when the transgenic plant and progenitor plant are cultivated under identical environmental conditions, where the component is any one of the polypeptides cited above. The nucleic acid molecules are useful for producing transgenic plants with improved characteristics. The present sequence is an ortholog of a protein encoded by a plant nucleic acid (cDNA) of the invention. osteopathic; vulnerary; cytostatic; gene therapy; diagnosis; forensics; gene mapping; mutation identification; biodiversity; chromosome marker; immune response; myenloid cell disorder; lymphoid cell disorder; bone cartilage; tendon; ligament; nerve tissue growth; wound healing; burns; incision; ulcer; cancer. The invention relates to novel isolated polynucleotides or a sequence encoding a polypeptide with biological activity, where the polynucleotide with biological activity, where the polynucleotide to the polynucleotide under stringent hybridization conditions or has greater than 99% sequence identity with the polynucleotide. The polynucleotides and polypeptides are useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic also disorders and other traits, to assess biodiversity, as nutritional sources or supplements. The polynucleotides may also be used as molecular weight markers, chromosome markers or map related gene positions, or as an antigen to rasise anti-DNA antibodies or elicit immune response. The polypeptides are useful for raising antibodies, as markers for tissues in which the corresponding polypeptide is expressed, for re-engineering damaged or diseased tissues, for treating myeloid or lymphoid cell calsoners, in bone cartilage, tendon, ligament and/or nerve tissue growth car regeneration, in wound healing, in tissue repair and replacement, in healing of burns, incisions and ulcers, and in treating cancer. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                            New polynucleotides and secreted proteins, useful for treating myeloid or lymphoid cell disorders, in bone cartilage, tendon, ligament and nerve tissue growth or regeneration, in wound healing, and in tissue repair and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Drosophila, developmental biology, cell signalling, insecticide,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

The invention describes a recombinant DNA construct comprising a valiable in electronic form from the US patent office at available in electronic form from the US patent office at ftp. seqdata.uspto.gov/sequence.html?Doc1D:2004034888. The polynucleotide of the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme commotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This is the amino acid sequence of a plant full length insert polypeptide that can be used in the recombinant DNA construct of the

                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                        The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL1840-ABL16175, and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New recombinant DNA construct, useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for conferring increased resistance to plant disease, or for improving yield.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   plant protectant; plant growth regulant; gene therapy; plant; recombinant DNA construct; physical array; plant breeding marker; cold tolerance; heat tolerance; drought tolerance; herbicide tolerance; extreme osmotic condition; pathogen tolerance; pest tolerance; growth rate; cell cycle pathway; disease resistance; galactomannan production; lignin production; plant growth regulator; yield; plant growth; plant development; seed oll; protein yield; protein yield;

The invention describes a recombinant DNA construct comprising a polynucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant colerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for increasing the rate of homologous recombination in plants, for imprevaing yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This is the amino acid sequence of a plant full length insert in the polymetric content. This is the amino acid sequence of a plant full length insert in the recombinant DNA construct of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .

                                                                                                                                   The invention relates to nucleic acids and encoded polypeptides which are cancer associated antigens expressed in patients afflicted with small cell lung cancer. The molecules provided by the invention can be used in the diagnosis, monitoring, research or treatment of conditions characterised by the expression of one or more cancer associated antigens. The polypeptide is used to treat a disorder characterised by expression of an expression of an abnormal amount of a protein encoded by a nucleic acid (NA) Group I molecule. The disorders are small and non-small cell lung cancer, melanoma, colon, breast, head and neck, or transitional cancer, leimyosarcoma or synovial sarcoma. The present sequence is human SOX3 protein, encoded by a small cell lung cancer associated gene designated as NY-SCLC-9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is
                                       Isolated polypeptide, used to treat or prognose a disorder characterized by expression of a hCAAP e.g. cancer, is encoded by an isolated nucleic acid comprising an NA Group 3 or 4 molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a transgenic fly whose genome comprises DNA encoding a polypeptide having the Abeta portion of human amyloid precureor protein (APP), fused to a signal sequence. The DNA sequence encodes a 123 (Abeta40) or 129 (Abeta42) amino acid sequence, given in the specification. The DNA sequence is operably linked to a tissuethe fly an altered phenotype. The purpose of the invention is for identifying agents that inhibit or promote the expression and/or function of genes or encoded polypeptides which modify the APP pathway. The agent is a compound, triple helix DNA, antisense oligonuclectide, double stranded RNA molecule, ribozyme, or particularly an antibody. It is used to treat conditions such as Alzheimer's disease. The agent can be used as an APP pathway modulator or in gene therapy. This sequence represents the
                                                                                                                                                                                                                                                                                                                                                                                                           Neuroprotective; nootropic; transgenic fly; Alzheimer's disease; Abeta; amyloid precursor protein; tissue-specific expression control; human APP; APP pathway modulator; gene therapy.
useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL0176-ABL30511), expressed DNA sequences (ABL0176-ABL30511), expressed DNA sequences (ABL0176-ABL30511), expressed DNA sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New transgenic fly, containing DNA encoding an Abeta portion of human APP, useful for identifying agents which modulate the APP pathway and which can be used to treat Alzheimer's disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a transgenic fly whose genome comprises DNA encoding a polypeptide having the Abeta portion of human amyloid precursor protein (APP), fused to a signal sequence. The DNA sequence encodes a 123 (Abeta42) amino acid sequence. The DNA sequence is operably linked to a tissue-specific expression control sequence. Expression of the sequence given in the fly an altered phenotype. The purpose of the invention is for identifying agents that inhibit or promote the expression and/or function of genes or encoded polypeptides which modify the pathway. The agent is a compound, triple helix DNA, antisense oligonucleotide, double stranded RNA molecule, ribozyme, or particularly an antibody. It is used to treat conditions such as Alzheimær's disease. The agent can be used as an APP pathway modulator or in gene therapy. This sequence represents the protein of the APP related human homologue hCP41313 #2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Neuroprotective; nootropic; transgenic fly; Alzheimer's disease; Abeta; amyloid precursor protein; tissue-specific expression control; human APP; APP pathway modulator; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New transgenic fly, containing DNA encoding an Abeta portion of human APP, useful for identifying agents which modulate the APP pathway and which can be used to treat Alzheimer's disease.
                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed control in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is custful for generating antibodies against it, detecting or quantitating a custful for generating antibodies against it, detecting or quantitating a cupplement. (II) and its binding partners are useful in medical imaging of states expressing (II). (I) and (II) are useful for treating disorders of states expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein esquences have applications in collypeptide and polynucleotide sequences have applications in cresponsible for genefic disorders or other trails to assess biodiversity and to produce other types of data and products dependent on DNA and cannon acid sequences of the invention. Note: The sequence data for this amino acid sequences of the invention. Note: The sequence data for this caterial format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to novel abiotic stress responsive polynucleotides and polypeptides. Also disclosed are vectors, expression cassettes, host cells, and plants containing such polynucleotides. Also disclosed are methods for using the polynucleotides and polypeptides to alter the responsiveness of a plant to abiotic stress. The invention is useful in agriculture. The nucleic acid is useful for determining whether a test plant has been exposed to an abiotic stress condition. It is also useful for selecting an agent that alters abiotic stress regulated for selecting an abiotic stress polynucleotide expression in a plant cell, and to identify a homolog or ortholog to an abiotic stress responsive polynucleotide. The nucleic acid molecule and the polypeptide encoded by it are useful in altering the responsiveness of a plant to an abiotic stress, such as cold stress, salt stress, osmotic stress ray of their combinations. The present sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New stress-responsive nucleic acid, useful for altering the responsiveness of a plant, e.g. cereal, to an abiotic stress such as cold stress, salt stress or osmotic stress.
                                                                                                                                                                                                                                                                                                                                                                  abiotic stress tolerance; transgenic plant; plant; cereal; agriculture.

                                                                      The present invention describes a superantigen binding site within the CD28 molecule that specifically and directly binds to a superantigen. Also described: (1) a method for treating a superantigen-related disorder in a mammalian subject; (2) a method of inhibiting pyrogenic exotoxin-mediated activation of Th1-1ymphocytes and protecting against toxic shock induced by a pyrogenic exotoxin or by a mixture of pyrogenic exotoxins, in a subject; (3) a method of eliciting protective immunity against toxic shock induced by a pyrogenic exotoxin in a subject; (4) a substance that inhibits the binding of a superantigen to a superantigen binding site in CD28; (5) a pharmaceutical composition for treating or preventing superantigen-related disorders comprising the substance that inhibits the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               preparing a pharmaceutical composition for treating superantigen-related disorders caused by Staphylococcus aureus or Streptococcus pyogenes. The present sequence represents an sCD28 molecule related peptide motif, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                preparing a pharmaceutical composition for treating superantigen-related disorders caused by Staphylococcus aureus or Streptococcus pyogenes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        direct interaction between CD28 molecule and the pyrogenic exotoxin, which leads to antagonising of toxin-mediated activation of Thi lymphocytes; (6) an isolated and purified peptide having an amino acid sequence homologous to an amino acid sequence comprised within a superantigen binding site within the CD28 molecule, (7) a method of screening for a test substance which specifically binds to the CD28 molecule and is capable of antagonising pyrogenic exotoxin-mediated activation of Thi lymphocytes and optionally of eliciting protective immunity against toxic shock induced by a pyrogenic exotoxin or by a mixture of at least two pyrogenic exotoxins; and (8) a method of preparing a therapeutic composition for treating a superantigen-related disorder in a mammalian subject. The substance and pharmaceutical composition have antibacterial activities, and can be used in gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New superantigen binding site within the CD28 molecule, useful for

The present sequence is that of a peptide of potential use for production of a coded probe useful in the method of the invention. The sequence was obtained by solid-phase peptide synthesis, and is pradicted to be an alpha helix. The invention provides methods, apparatus and compositions for the detection, identification and/or sequencing of biomolecules, such as nucleic acids or proteins. Coded probes comprising a probe molecule attached to one or more nano-barcodes are allowed to bind to target molecule and coded probes are allowed to bind to target complex cound coded probes are allowed to bind to target to probe microscopy (SPW). The nano-barcodes may be any molecule or complex that is distinguishable by SPW, such as carbon nanotubes, fullarenes, submariner metallic barcodes, nanoparticle or quantum dots. The methods allow the sequencing of long mucleic acid sequences in a single sequencing run, high sefficiency in terms of operator time, and sensitive and accurate detection and/or identification of nucleic acids with low
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ..
Detecting, identifying and sequencing of biomolecules using controlled alignment of nano-barcodes encoding specific information for scanning probe microscopy, useful in the fields of molecular biology.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method for determining a nucleotide sequence of a nucleic acid. The method comprises: (a) providing one or more coded oligonucleotide probes, each coded oligonucleotide probes comprising an oligonucleotide associated with at least one nanocode comprising a detectable non-encoding feature; (b) contacting a target nucleotide acid with the one or more coded oligonucleotide probes; and (c) identifying coded oligonucleotide probes that bind to the target nucleotide acid using scanning probe microscopy (SPM) to detect the nanocode and the detectable non-encoding feature. Nanocodes of the invention in certain aspects include detectable features beyond the arrangement of tags that concode information about the barcoded object. The tags that encode information about the barcoded object. The detecting the tags that encode information about the barcoded object. The concode information about the barcoded object. The detectable features include structures of a nanocode or associated with a nanocode, referred to as detectable feature tags, for error.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  checking/error correction, encryption and data reduction/compression. The present sequence represents a synthetic peptide which connects four buckeyballs on graphite in an example from the present invention, where the example is about the synthesis and SPM scanning of a nanocode.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying target nucleic acid sequence, by contacting target nucleic acid with coded oligonucleotide probes, and identifying probes binding to

the invention transce to inverse cause converse.

The invention transce to inverse cause converse.

The invention also relates to these cDNA sequences proteins (ADN13970). The invention also relates to vectors and host cells comprising a nucleic acid of the invention; a method for the recombinant production of a protein of the invention; a method for the recombinant confined a protein of the invention; a method for the recombinant confined acid sequence of the invention; a method for detecting a cancerous cell by PCR or probe hybridisation; inhibiting at least concernus cell by PCR or probe hybridisation; inhibiting at cancerous phenotype (particularly aberrant proliferation) of a cell; a method of identifying an agent that modulates the biological activity of a gene or product differentially expressed in a cancerous cell; a method of control cell; and a method of treating a cancer or product differentially expressed in a cancerous cell; ompared with a normal cell; and a method of treating a cancer patient using the agent of product differentially expressed and polypeptides can be used to diagnose, controlling or prognose, treat or prevent cancers such as prostate, colon, lung or prognose, treat or prevent cancers such as prostate, colon, lung or prognose, treat or prevent cancers such as prostate, colon, lung or cancer. The nucleic acids can also be used for gene mapping, tissue concerned and for this patent did not form part of the printed specifically claimed cancer-related protein of the invention. Note: The specifically chaimed in the print of the printed forms and or prevent of the printed forms and propertion of the printed forms of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                profiling, as diagnostic reagents, and for gene mapping or tissue typing or e.g. prostate, colon, or breast cancer.
breast cancer; drug screening; diagnosis; prognosis; prevention;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide sequences in the specification, or their complements or fragments, and encoding at least 8 amino acids of any of the 6888 amino acids sequences ("Illy defined in the specification. The probe is a single exon probe that bybridises under high stringency conditions to a nucleic acid molecule expression (comprising a plurality of single exon nucleic acid molecule expression (comprising a plurality of single exon nucleic acid gene expression (comprising a plurality of probes is separately and addressably isolatable or amplifiable from the plurality), a single exon addressably isolatable or amplifiable from the plurality), a single exon addressably isolatable or amplifiable from the plurality), a single exon addressably isolatable or amplifiable from the plurality), a single exon addressably isolatable or amplifiable from the plurality), a single exon microarray for measuring human gene expression, a vector comprising the single exon probe cited above, where each of the above- mentioned amino acid of any of the above- mentioned amino acid sequences (optionally with conservative amino acid substitutions), an isolated antibody that binds specifically to a peptide cited above, methods of selling and/or licensing single exon probes or microarrays to a customer desiring to measure gene expression, a method of providing human gene expression data by subscription, and a computer-readable exorped each record including data on the expression of a single exon probe expression analysis. The probes may be used as tools for surveying the above. The probes are used a tools for surveying a cited above. The probes are used in identifying and characterising gross a leterative splicing events, in priming the synthesis of nucleic acids, or in constructing genome-decived single exon microarrays. In addition, the probes are used in identifying and characterising grantler genomic alterations, in priming 
                                                                                                                                                                                                                                                                                                                                                                                                                         New human genome-derived single exon nucleic acid probes useful for human gene expression analysis, for identifying or characterizing alternative splicing events, for assessing genomic alterations or as tools for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               segdata.uspto.gov/seguence.html?DocID=20030194704

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain caction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed contains an expressed sequence tags for identifying expressed containing the charapy techniques to reserve normal cutivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (II) and (II) are useful for treating disorders involving abberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in capponsible for genetic disorders or other traits to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    and to produce other types of data and products dependent on DNA and amino acid sequences. ABG0010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                       Human, chromosome mapping, gene mapping, gene therapy, forensic, food supplement, medical imaging, diagnostic, genetic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;;

capable of detecting 1000 or more genes from brosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher enkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABBS7737-ABB7072). The sequence data for this patent did not form part of the from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                            New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cytostatic; antipsoriatic; antiinflammatory; gene therapy; Nanodisc; proliferative disorder; inflammatory disorder; immune disorder; metabolic disorder; bone disorder; CNS disorder; cancer; psoriasis;

```
The invention relates a recombinant DNA construct comprising a CC polymucleotide having any of 5544 mucleotide sequences (CDNAs SEQ ID NO: 1-5544) and encoding a polypeptide with any of 5544 amino acid sequences (1-5544) and encoding a polypeptide with any of 5544 amino acid sequences (SEQ ID NO: 5545-11088). The CDNAs and proteins are from corn, soybean, Arabidopsis, wheat and rape but the specification does not indicate which sequences is derived from which organism. Also included is a method of producting a plant having an improved property, comprising transforming a plant with a recombinant DNA construct comprising a promoter region tunctional in a plant cell operably joined to a polynucleotide encoding a CC plant. The property is selected from improving plant cold tolerance, for plant. The property is selected from improving plant cold toleranse, for pathway, for improving plant tolerance, for galactomannan production, for production of plant growth regulators, for improving plant tolerance to plant disease, for galactomannan production, for improving plant tolerance to herbicides, for increasing the rate of improving plant tolerance to extreme osmotic conditions, for improving plant tolerance to extreme osmotic conditions, for improving plant tolerance to extreme osmotic conditions, for improving plant tolerance to pathogens or pests, for yield improvement by modification of conditioning seed oil yield improvement by modification of modifying seed protein yield and/or content, for yell improvement by modification of carbohydrate, nitrogen or phosphorus use and/or uptake and for yield improvement by providing improved plant growth and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New recombinant DNA constructs useful in the field of biochemistry and genetics, and in particular for producing transgenic plants with improved biological characteristics.
                                                                                                                                                                                                                                                                                                                                                                                                      Plant; transgenic; cold tolerance; growth rate; drought tolerance; disease resistance; galactomannan production; plant growth regulator; heat tolerance; herbicide tolerance; lignin production tolerance; extreme osmotic condition tolerance; pathogens resistance; pest resistance;

Chu K, Masuoka L,

The invention describes a new first nucleic acid molecule comprising a polymucleotide sequence given in the specification. Also described are: an animal injected with the nucleic acid molecule; a second nucleic acid molecule; a second nucleic acid molecule and animal injected with the nucleic acid molecule and settingence comprising a second polymucleotide sequence that is at least abour 70 80, 90 or 95% homologous to the first nucleic acid molecule and a tringency conditions; a vector comprising the nucleic acid molecule; a promoter that drives the expression of the mucleic acid molecule; a promoter that drives the expression of the mucleic acid molecule; and one composition comprising the nucleic acid molecule; and one crop composition comprising the polypeptide and a carrier or before cell; a substantially purified polypeptide; and nucleic acid molecule; weetor or host cell; a substantially purified polypeptide; and minal injected with the polypeptide and a carrier or buffer; a cell animal injected with the polypeptide or polypeptide or transfected cells cransfected with the polypeptide molecule and a carrier or buffer; acid molecule; vector or host cell; a substantially purified polypeptide; or comprising the polypeptide molecule; worthersising a series of simultaneously-symthesised Nanodises coll transfected with the polypuppid the molecule or transfected with the polypeptide molecule or from the polypeptide or transfected with the proposed processor of the molecial activity; a disquestic composition comprising the presence of the nucleic acid molecule or in endinger and for symthesising and the presence of the nucleic acid molecule or modulating the antendry specifically recognising, binding to or modulating the bacteriophage; a non-human animal injected with the antibody composition; a host cell that secretes the antibody is displayed on the bacteriophage; a non-human animal, and one or more cells desired with the antibody composition; a molecule and disease, disorder, syndecules and carriers; gene thera invention. us-10-617-568-2.rag

                                                                                                                                                                                     ö
development under at least one stress condition. The polynucleotide may also encode a plant transcription factor. The methods and compositions of the present invention are useful in the field of blochemistry and genetics, in particular for producing transgenic plants with improved blological characteristics such as increased yield, improved nitrogen flow, increasing plant tolerance to cold or heat, improving plant tolerance to extreme osmotic and drought conditions, and improving plant tolerance to plant pests or pathogens. They can also be used in physical arrays of molecules, plant breeding markers, computer-based storage and analysis systems. The present sequence is one of the 5544 plant protein sequences of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in sequence clearronic format directly from USPTO at

The invention relates to a transgenic plant having an altered trait as compared to a wild type or untransformed plant. The trait is altered, i.e. increasing or decreasing levels of at least one cell protectant in cells of the transgenic plant to rattered, i.e. increasing or decreasing levels of biomass, where the transgenic plant is transformed with a cells of blomass, where the transgenic plant is transformed with a crecombinant polymucleotide comprising an AP2 domain. Also included are a cold inducible promoter comprising an AP2 domain. Also control of the Rabls or Dreb2a promoters, a method of inducible promoter comprising an AP2 domain. Also controlly the levels of a cell protectant in a cell, a method for inducitying the levels of a cell protectant in a plant cell, a method for controlly the tolerance of a plant cell to an environmental stress, a method of altering the biomass of a method of sof altering the biomass of a plant. The improved environmental stress is selected from a decrease in content of a plant is or cells injury, plant sequence to cold temperatures, survival of a plant after exposure to freezing temperatures, cextent of a plant after exposure to drought conditions, cextent of a plant after exposure to drought conditions, cextent of a plant after exposure to drought conditions, cextent of a plant after exposure to drought conditions, cextent of a plant after exposure to drought conditions, cextent of a plant after exposure to drought conditions, cextent of a plant after exposure to high salt conditions; and which has survival of a cell after exposure to high salt conditions; and which has an increased tolerance to an environmental stress, e.g. drought, cold, the plant after the present sequence represents a plant CBF or handled or high salt. The present sequence represents a plant CBF or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New transgenic plants comprising C-repeat/DRE binding factor, useful in producing phenotypes with increased tolerance to an environmental stress. e.g. drought, cold, freezing or high salt.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            transgenic; plant; enhanced tolerance to abiotic stress; glyphosphate tolerance; hormone sensitivity; disease resistance; sugar sensing; flower structure; stem bifurcation; branching pattern; apical dominance; trichome; stem morphology; root growth; root hair; seed development; call proliferation; call differentiation; premature senescence; necrosis; plant size; leaf morphology; seed morphology; seed biochemistry; root anthocyanin;

The invention describes a transgenic plant comprising a recombinant polymucleotide of any one of more than 500 nucleotide sequences fully defined in the specification or its complement. The method of the invention can be used to produced a plant having altered traits such as invention can be used to produced a plant having altered traits such as: enhanced tolerance to abiotic stress; glyphosphate tolerance, hormone sensitivity; disease resistance; sugar sensing; early or late flowering; altered flower structure, change in stem biturcations, altered branching pattern, reduced apical dominance, reduced trichome density; lack of trichomes; reduced ectopic trichome development; altered stem morphology; increased root growth; increased root hairs; altered stem morphology; increased root growth; increased root hairs; altered seed development; premature senescence; increased necrosis; increase in seedling or plant; premature senescence; increased morphology; seed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 biochemistry; increase in root anthocyanins; increase in plant anthocyanins, or alteration in light response or shade avoidance. The transgenic plant, polymucleotides and polymeptides are useful in bioinformatic search methods. This is the amino acid sequence of a plant transcription factor, and an orthologue of Arabiodopsis thaliana transcription factors isolated in the invention, that can be used in the creation of a transgenic plant with altered traits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New transgenic plant comprising a recombinant polynucleotide of any one of more than 500 nucleotide sequences, useful in bioinformatic search
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Haake V;

The invention describes a method of producing a transformed plant comprises transforming a target plant with the first polynucleotide, which is a member of the CBF clade of transcription factors, and is mutagenized to produce a second or a third polynucleotide, where the second or third polypeptide has an amino acid sequence different than the first polypeptide, and identifying a transformed plant comprising the second polynucleotide or the third polynucleotide. Also described are: a transgenic plant produced by the method above; a seed produced by the transgenic plant, where the seed comprises the second or third

Producing transformed plant, by transforming a target plant with a first polynucleotide, which is a member of the CBF clade of transcription factors, and which is mutagenized, and identifying a transformed plant.

Example 9; SEQ ID NO 178; 225pp; English.

RESULT 36

AEE27925

polymucleotide; and a transgenic plant comprising a recombinant, overexpressed mutated polymucleotide that encodes a mutant member of the cupe class class of transcription factor polypeptides, where the transgenic plant exhibits fewer or reduced adverse morphological or developmental effects than a plant that overexpresses a wild-type form of the mutated plynucleotide. The method is useful for producing a transformed plant having increased abiotic stress tolerance, as compared to wild type or control plants. This is the amino acid sequence of a CBF clade

                                                                                                                                                                                                                                                                                                                                            The invention describes a method of producing a transformed plant comprises transforming a target plant with the first polynucleotide, which is a member of the Cadee of transcription factors, and iss mutagenized to produce a second or a third polynucleotide, where the second or third polypeptide, and identifying a transformed plant comprising the first polypeptide, and identifying a transformed plant comprising the second polynucleotide or the third polynucleotide. Also described are: a transgenic plant produced by the method above; a seed produced by the transgenic plant, where the seed comprises the second or third overexpressed mutated polynucleotide that encodes a mutant member of the CBF clade of transcription factor polypeptides, where the transgenic
                                                                                                                                                                                                                                                                        Producing transformed plant, by transforming a target plant with a first polynucleotide, which is a member of the CBF clade of transcription factors, and which is mutagenized, and identifying a transformed plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         plant exhibits fewer or reduced adverse morphological or developmental effects than a plant that overexpresses a wild-type form of the mutated polymucleotide. The method is useful for producing a transformed plant having increased abiotic stress tolerance, as compared to wild type or control plants. This is the amino acid sequence of a CBF clade transcription factor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention comprises the amino acid and coding sequences of novel proteins. The DNA and protein sequences of the invention are useful as: markers for tissues in which the corresponding protein is preferentially expressed, as molecular weight markers on gels; as chromosome markers or tags; to identify chromosomes or to map related gene positions; and to compare with endogenous DNA sequences in patients to identify potential genetic disorders. The present amino acid sequence represents a protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Zhao QA, Wang J;

```
The invention describes an isolated polynucleotide comprising a nucleotide sequence selected from 124 nucleotide sequences (SEQ ID NO: 1-
124), or a polynuclectide enroding a polypeptide with biological
cativity, where the polynucleotide hybridises to the nucleotide sequence
under stringent hybridisation conditions or has greater than 99% sequence
cuder stringent hybridisation conditions or has greater than 99% sequence
cuder stringent hybridisation conditions or has greater than 99% sequence
conditions in therapeutic, diagnostic (as expressed sequence
tags for identifying expressed genes) and research methods such as gene
mapping, forensics, identification of mutations responsible for genetic
disorders or other traits, to assess biodiversity, and to produce many
cother types of data and products dependent on DNA and amino acid
disorders or other traits, to assess biodiversity, and to produce many
cother types of data and products dependent on DNA and amino acid
sequences. The polynucleotide or the polypeptide is useful in methods for
conserving and/or treating disorders involving aberrant protein
control many anyloid or lymphoid cell disorders and for treating
and myasthenia gravis, in bone, cartilage, tendon, ligament and/or nerve
control many are placement, and in healing of burns, incisions and utsers,
control disease. The composition is useful in assays for
crepair and replacement, and in healing of burns, incisions and utsers,
controliferation and differentiation of various hematopoietic lines, assays
con periodontal disease.

Con periodontal mervens evertem disease and neurons of various neural cells
and neripharal nervous system diseases and neurons and neural disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  and peripheral nervous system diseases and neuropathies, as well as mechanical and traumatic disorders, which involve degeneration, death or trauma to neural cells or nerve tissue, particularly diseases such as peripheral neuropathy and localised neuropathies, Alzheimer's disease, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy'-Drager syndrome, as well as stroke. This sequence represents a novel polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated polynucleotide, useful in therapeutic (i.e. for treating e.g., cancer, neurodegenerative disorders), diagnostic (as expressed sequence tags for identifying expressed genes) and research methods
amyotrophic lateral sclerosis; Shy-Drager syndrome; stroke; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 10; SEQ ID NO 161; 138pp; English.

The invention describes a method of treating a mammal having a tumor of glial origin comprising cells that express a type A or B glial tumor antigen comprises contacting the cells with a composition of: a first binding agent comprising a first antibody, oligopeptide or organic molecule that binds to a type A or B glial tumor antigen; and a second binding agent comprising a second antibody, oligopeptide or organic molecule that binds to a type B or A glial tumor antigen. Also described is a method of determining the presence of a type A or B glial tumor in a mammal. The method is useful in treating a mammal at unor of glial origin comprising cells that express a type A or B glial tumor of glial origin comprising cells that express a type A or B glial tumor antigen. This sequence represents a human tumor-associated antigenic target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Treating a mammal having a tumor of glial origin comprising cells that express a type A or B glial tumor antigen by contacting the cells with a composition comprising first and second binding agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
